

File-based Routing Instead Of Code-based Routing

No react-router, no in-code route definitions

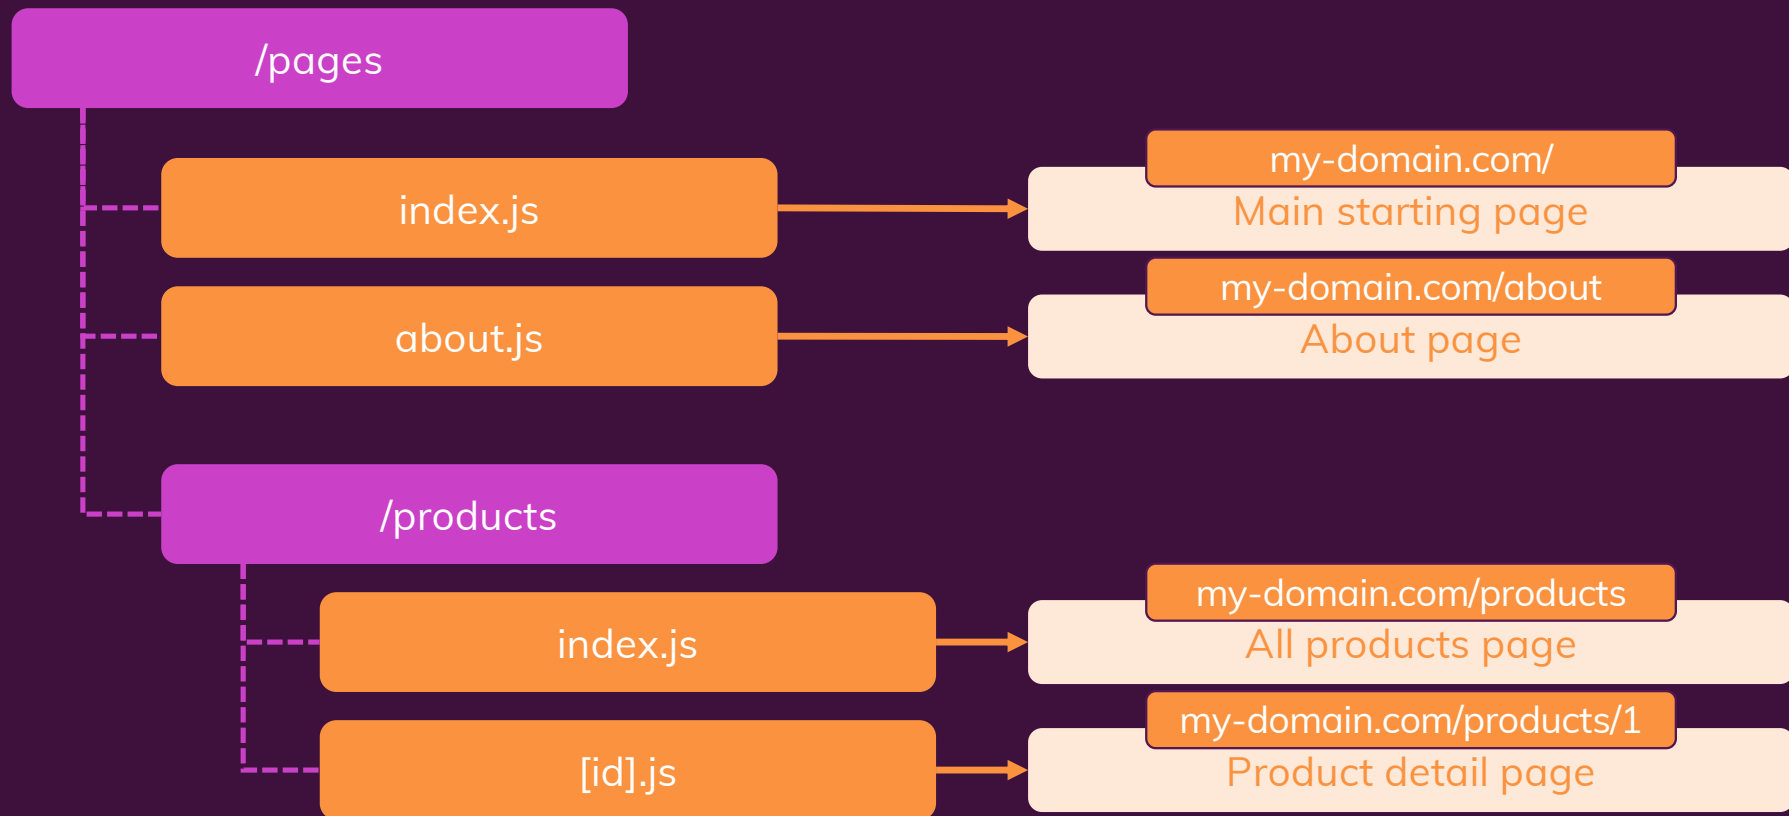

File-based Routing Instead Of Code-based Routing

Instead: Create React component files and let NextJS infer the routes from the folder structure

The special /pages folder

How File-based Routing Works

File-based vs Code-based

File-based Routing (NextJS)

No extra boilerplate code
required

Intuitive system

File + folder structure (in pages/
folder) influences routes

Navigation works with `<Link>`
component and imperatively

Code-based Routing (React + react-router)

Boilerplate setup in code required
(`<Switch>`, `<Route>`, ...)

Straightforward but includes new
components + concepts

File + folder setup does not
matter at all

Navigation works with `<Link>`
component and imperatively
